Final Project Proposal

Name of project Kill, Flirt, Marry (or KFM Subject to change)

The point of this project will be to make the game kill f*** Mary using python. The point of this game is to pick three people you would want to kill flirt or marry. This game is played among high school, middle school kids and can be a lot of fun and time consuming by picking three people that would embarrass you. When looking online I searched and there was no automated KFM game out there just ones with preset pictures or you need a friend. The idea of the project will be to make an automated KFM game that will be played single player. We will use Facebook friends, or preset packages of categories of peoples like athletes, celebrities, etc. They will choose three of which they want to kill, flirt, or marry at random and stop until you finish or run out of choices.

Goals:

- Incorporate Facebook to generate three random people.
- Incorporate google img search to generate three random people from certain categories
- Have a filter using a gui to allow for girls or boys, age.
- Have animations and sounds for killing, flirting, or marry

Extra Goals:

- Incorporate twitter
- Allow for sharing of results on facebook/twitter

Team members:

David Robinson

Division of labor: all

Packages:

Pyqt for the Gui

Pygame for the actual game

Django or facebook sdk for facebook intergration
